

## Reminders

$$1000 \text{ mL} = 1 \text{ L}$$

$$1 \text{ mL H}_2\text{O} = 1 \text{ g H}_2\text{O} \text{ (based on density of H}_2\text{O } 1)$$

$$1000 \text{ g} = 1 \text{ kg}$$

Freezing point of water  $0^\circ\text{C}$

Boiling point of water  $100^\circ\text{C}$

Mar 10-7:39 AM

## Colligative Properties

**Colligative Property:** a property that depends only on the **number** of solute particles, and not the **type** of particle.

*Examples of some colligative properties:*

1. Freezing Point Depression
2. Boiling Point Elevation
3. Vapor Pressure Lowering

We will focus on Freezing Point and Boiling Point.

Apr 25-8:04 AM

## Freezing Point Depression

What happens when something freezes (for example, water)?

- Decrease in energy slows molecules/atoms down
- Intermolecular forces have more effect (atoms have less energy to fight them)
- Frozen water (ice) molecules are in an orderly pattern.

What happens when you add a solute?

The addition of another substance (a solute) disrupts and prevents water molecules from forming an orderly pattern.

**Freezing Point Depression:** adding a substance to a pure solvent *lowers* the freezing point

Mar 10-7:41 AM

## Boiling Point Elevation

Pure solvent

Solution containing nonvolatile solute

Solute particles also get in the way of a solvent's ability to boil thereby increasing the boiling temperature.

**Boiling Point Elevation:** adding a substance to a pure solvent *increases* the boiling point

Mar 10-7:45 AM

## Dissociation Factor

**Dissociation factor:**

How many particles the solute will break in to in solution.

### Dissociation Factor

Covalent compounds: will not dissociate  $\rightarrow i = 1$   
 Ionic compounds: will dissociate into ions  $\rightarrow i = \# \text{ of ions per compound}$

\*\*\* The larger the dissociation factor, the lower the freezing point and higher the boiling point.\*\*\*

\*\*\*\* Count the number of IONS NOT ATOMS

Mar 10-7:46 AM

## Dissociation Factor

examples

What is the dissociation factor for each compound? Which will raise the boiling point the most? Lower the freezing point the most?

1.  $\text{AlPO}_4$
2.  $\text{N}_2\text{O}_4$
3.  $\text{LiCl}$
4.  $\text{CaI}_2$
5.  $\text{PCl}_5$
6.  $\text{Pb}(\text{OH})_4$
7.  $\text{XeF}_4$
8.  $\text{Cu}_2\text{CO}_3$

Mar 10-7:47 AM

## Dissociation Factor

examples

What is the dissociation factor for each compound? Which will raise the boiling point the most? Lower the freezing point the most?

1.  $\text{AlPO}_4$   $i = 2$ :  $\text{Al}^{3+}$ ,  $\text{PO}_4^{3-}$
2.  $\text{N}_2\text{O}_4$   $i = 1$ : covalent
3.  $\text{LiCl}$   $i = 2$ :  $\text{Li}^+$ ,  $\text{Cl}^-$
4.  $\text{CaI}_2$   $i = 3$ ,  $\text{Ca}^{2+}$ ,  $\text{I}^-$ ,  $\text{I}^-$
5.  $\text{PCl}_5$   $i = 1$ : covalent
6.  $\text{Pb}(\text{OH})_4$   $i = 5$ :  $\text{Pb}^{4+}$ ,  $\text{OH}^-$ ,  $\text{OH}^-$ ,  $\text{OH}^-$ ,  $\text{OH}^-$
7.  $\text{XeF}_4$   $i = 1$ : covalent
8.  $\text{Cu}_2\text{CO}_3$   $i = 3$ :  $\text{Cu}^+$ ,  $\text{Cu}^+$ ,  $\text{CO}_3^{2-}$

Mar 10-7:47 AM
